

DEPTH FILTER

Filtration Systems Swirl Flow technology in depth filter design provides exceptionally long life, high efficiency and low restriction to flow. This superior element eliminates premature plugging. Available in bleached and natural cotton.

Cotton's fine fiber diameter and oleophilic properties make it an ideal medium for hydrocarbon filtration. We use only natural cotton fibers (not textile waste) in our products. Wood absorbs water and acids (extending lube oil drain intervals) and improves the filter's flow characteristics.

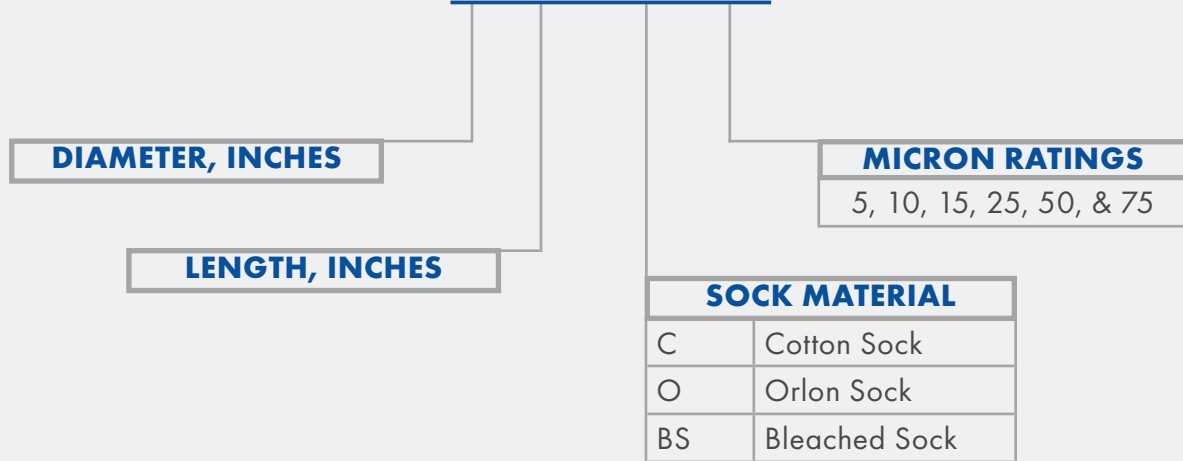

- A** Spiral lockseamed center tube has high collapse strength and excellent flow characteristics.
- B** Special medias are blended in-house and rolled with automated tensioning devices for a wide range micron efficiency ratings.
- C** A cotton or acrylic outer sock provides broad fluid compatibilities.
